Independent portfolio case study • No implemented interventions or measured financial benefits

Pro generated 64% of the net 2023 increase

Recorded subscription-order value rose from £4.15M to £4.60M (+10.72%). This is not MRR, ARR or recognised revenue.

THE EVIDENCE

2022 order value: £4,152,600

2023 order value: £4,597,700

Absolute uplift: £445,100

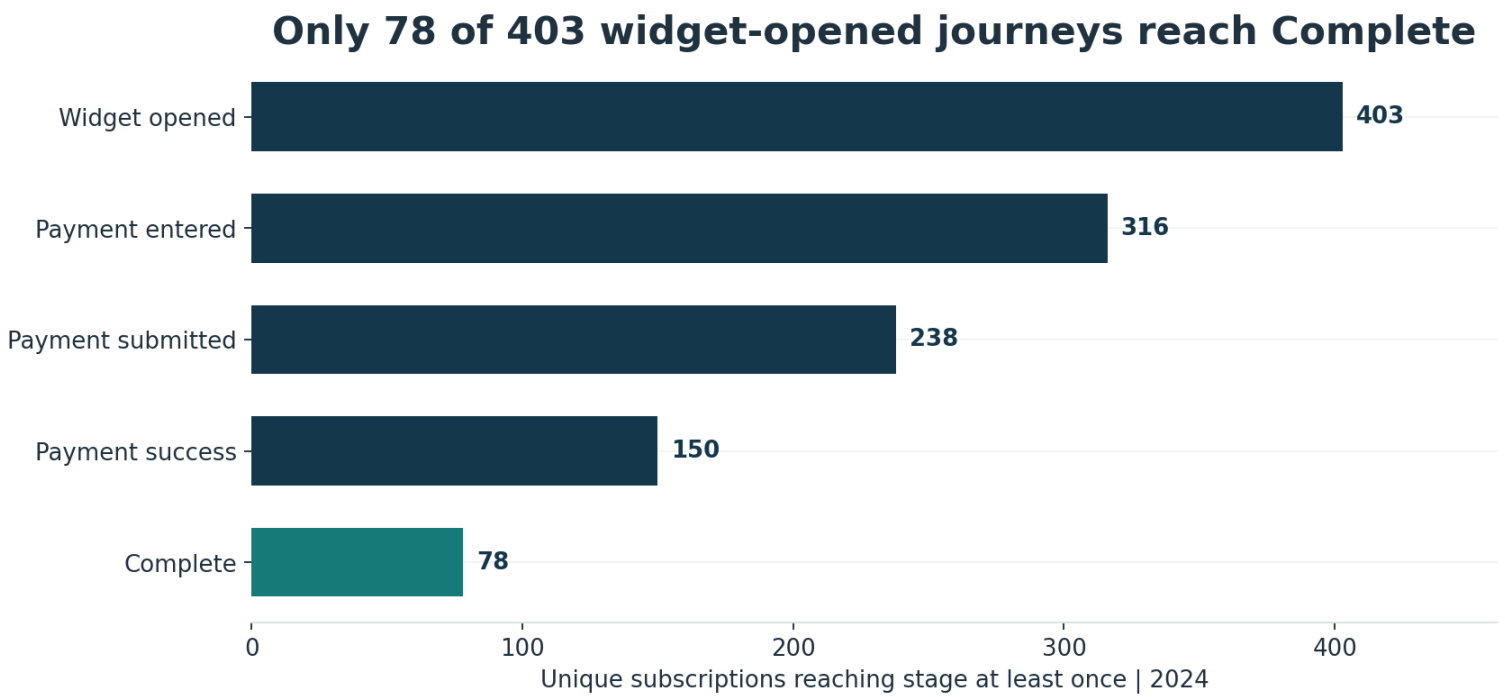

Pro contribution: £285,400

NEXT COMMERCIAL QUESTION

Was Pro growth driven by order size, transaction volume or customer mix?

The largest decision risk is the meaning of “Complete”

Unique subscriptions ever reaching each state; repeats within a subscription are counted once, not as independent attempts.

403 opened

150 Payment Success

78 Complete

19.35% complete / opened

119 subscription status flags disagree with the latest payment event. Validate payment-provider settlement before claiming recoverable lost sales.

Expansion and cancellation need controlled validation

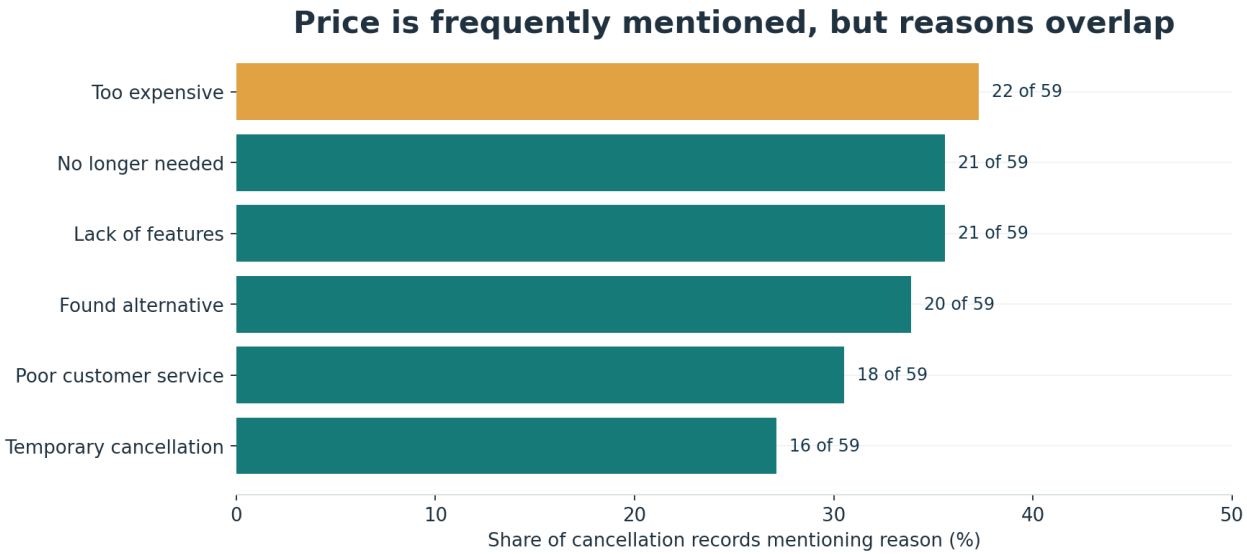

Account screening and reason mentions generate testable hypotheses, not conversion forecasts or a measured churn rate.

164 accounts

Active=1 source flag • one distinct product • at least 5,000 seats in the largest active subscription.

FIRST VALIDATION GATE

Verify customer identity, account seats, product fit and holdout design before outreach.

22/59 cancellation records mention price; overlapping reasons prevent simple causal conclusions.

Prioritise measurement before forecasting ROI

A deliberately conservative decision sequence: validate state semantics, pilot a targeted offer, then assess contribution after costs.

01 Payment instrumentation

Reconcile status flags with gateway settlement and add attempt IDs.

02 Expansion pilot

Validate 164 accounts and compare offer uptake with a control.

03 Pricing discovery

Interview cancellation cohorts before changing price architecture.

Illustrative only: at 10% uptake, £3,000 annual incremental value, 70% margin and £12,000 cost, modelled net is £22,440. No observed uplift.
